COMBINED AIR/WATER BOTTLE RINSER

AN INTEGRATED SOLUTION TO RINSE AND SANITIZE JARS AND BOTTLES BEFORE FILLING

This machine is designed for the internal cleaning and rinsing of bottles by means of filtered air or water and a disinfectant product. This machine allows you to easily clean bottles before filling them with your product, to guarantee product quality. The machine is entirely made of stainless steel.

The machine is equipped with a reservoir tank that needs to be filled with water and if wanted with a sanitizing product. The solution will be pumped through the nozzles under pressure, through the bottles.

Easy to clean, made of stainless steel.

The rinsing machine is available in 2 versions: either with 2 or with 4 injectors. We can equip the machine with different configurations:

- 2 rinsing nozzles and 2 blowing nozzles.
- 1 rinsing nozzles and 1 blowing nozzles.

Besides that, the machine is equipped with an air unit consisting of 3 elements:

- Pressure regulator complete with 5 μ m filter unit: This unit allows to adjust the air pressure sent to the injectors (adjustable from 0 up to 10 bar, suggested 4-6 μ m atm).
- Filter element with 0.3 μ m porosity: it protects the regulator from any oil or condensate traces that may be present in the air supplier of the compressor.
- Filter element (extra fine) using a 0.01 m cartridge.
