

MECHANICAL PRUNER, PRE-PRUNER MODEL S

Mechanical pruner, Pre-Pruner is used to remove annual woody shoots (osier). The cutting head is equipped with 7 cutting discs on each side. The distance between the discs is 100 mm or 5 mm. The special hydraulic system of the pruner allows for very precise work. Thanks to the quick opening and closing of the basket, a minimum number of shoots remain around the post. Pre-Prunner Model S is designed for winter pruning of vines conducted using the Guyot method. The length of the working section is 472 mm. The operation of the device can be automated - the camera precisely recognizes the position of the post and automatically controls the opening and closing of the working section.
